

The compact ELS 261 sensor from CEDES is universally applicable

Sensor Makes Flowers Talk

Landquart, 27. Mai 2005

Sensors from the opto-sensor manufacturer CEDES are being used in National Gardening Show (Buga) in Munich. In the "Garden Whisperer" exhibit, the ELS 261 sensor makes flowers speak.

The ELS 261 sensor is normally used for the safeguarding of automatic doors. Because of the compactness, the simple mounting possibilities and the excellent price / performance ratio, it is also ideal for many other uses. An example of one of these 'other applications' can be seen, respectively heard, at the German National Gardening Show.

As soon as someone approaches a plant in the "Garden Whisperer" part of the National Gardening Show, it begins to speak. In this way a rose tells the listener how it got its name, or some rosemary might explain where it originates and what cooking recipes it goes well with.

So that the plants don't have to babble away continuously, the CEDES ELS 261 sensor makes the decision for the flowers. As soon as a potential 'audience' approaches the plant, the ELS 261 sends a signal to the audio equipment installed around the corresponding plants and they begin to 'speak'.
