

*The Safe4 safety light curtain can be adapted and customized for the most varied demands*

## Flexible Safety

*Landquart, 24. March 2006*

**Safe4 is an extremely flexible and high-capacity safety light curtain system. Thanks to the modular construction, Safe4 optimally harmonizes to the most diverse range of duties.**

As the emitter and receiver light curtains are available with a module length of 120 mm, small access windows or openings can also be inexpensively safeguarded. Additional features such as Blanking, L-Configuration, Perimeter or Cascading allow even more customer specific adaptation possibilities.

Safe4 comes standard with the worldwide patented laser alignment system ILAS, which reduces alignment work and thus the machine downtime to a minimum. No other vendor can support this level of installation and service.

The excellent price / performance ratio of the Safe4 safety light curtain proves that adaptability and customer specific requirements are not synonymous with high cost.

Over 14 million different configurations are possible. And best of all: deliverable within 5-7 working days. So even the most extraordinary requirements can be quickly fulfilled.
